Informax Vector NTI installation

Insert the CD and it should start automatically. If this does not occur run Windows explorer or whatever your favorite program is to look at files. Go to the CD and in the main directory double click on the file “DEMO32”. This should bring up the screen below.

1. Click on Installation and Documentation and follow instructions.
2. Once installed go the Vector NTI program group and run the License Manager.

1. Click on Dynamic license settings tab
2. In the URL of DLS: box enter the URL that you have been sent.
3. Click “Test Connection”. It should tell you the connection is OK. (If not make sure the Web address is correct, that is the usual problem).
4. If OK, click on connect, then close. You are ready to go.
1. When you run Vector NTI the first time it will ask if you want to install the default databases, answer yes to all these so that you have restriction enzymes etc set up for you.

2. If when you run Vector NTI you end up with a blank screen. Go back to the Vector NTI program group and run “Database Explorer”. This will open the default database. You can delete files from the database and add them in a multitude of ways. You can also produce subbases, in which you can store files for different projects.

3. Have fun. Beginning April 15, I will run some “how to” type demos to help people with problems.
